

Cold Email + Google Maps System

Non-Captive Life Insurance Agent Outbound — 2-Month Test to Retainer

For: Lisa Berry From: Hassan, CrackClay Date: July 17, 2026

What we're solving

Your ICP is non-captive life insurance agents (1099, MLM-style, running their own brokerages). Meta lives on Instagram and TikTok. You want LinkedIn and cold email opened as a new pipeline and recruit source.

Two constraints from the call:

- **Compliance sensitivity.** You're in the SaaS compliance world. Cold outbound needs to stay inside common US market practice.
- **Speed.** Two months to find message-market fit, then move to scaled retainer.

The approach

PHASE 1 — TESTING (MONTHS 1-2)

Rigorous angle testing against non-captive agents using pre-warmed inbox infrastructure plus Claude Code driven automation. Goal: find the winning combination of ICP slice, offer, and copy before spending on scaled infrastructure.

- Build target list from Google Maps scraping. My brother's team already runs this for a similar client at 3M/mo sends, untapped data not sitting in Apollo, ZoomInfo, or Cognism.
- Segment non-captive vs captive using enrichment logic. LinkedIn Sales Nav alone won't catch this cleanly.
- Provision 250-270 pre-warmed mailboxes at \$1.50/inbox/mo. Live campaigns in 4-5 days, not 14-20.
- Redirect sender domains to your website.
- BCC main company mailbox on replies. Leads land in your team's inbox from Day 1.
- Automate the sequencer flow via Claude Code plus MCP. Your team gets a seat and can chat with the system directly.
- Angle test in parallel: multiple audience slices, copy versions, offers. Claude Code runs tens of variations without manual click-through in Clay.

Deliverables per week (Phase 1): 3,000-5,000 verified non-captive agent contacts, 20-30k emails sent, replies routed to your team via BCC, Friday report on what's converting and what to test next.

PHASE 2 — SCALE (MONTH 3+)

Once we have a winner, transition to retainer. Move to owned domains and owned inboxes if you want, or keep pre-warmed if pace matters more than ownership. You own the infrastructure either way.

Tech stack + budget (Phase 1)

Item	Provider	Cost
Pre-warmed mailboxes (270)	Vendor	~\$405/mo
Sequencer (Instantly / Smartlead / PlusVibe)	Your account	\$97-197/mo
Google Maps data extraction	CrackClay-run	included
Email verification	NeverBounce / Million Verifier	~\$50/mo
Claude Code seat	Your account	~\$100/mo
Total tech, monthly		~\$650-750/mo

You own every account. If we part ways, everything stays with you.

Our service fee

Phase 1: \$1,700/mo × 2 months for full campaign management (list, copy, campaign setup, angle testing, reporting, reply routing).

Phase 2 retainer: scoped after Phase 1 based on send volume and inbox count. Rough range \$2,500-4,000/mo.

Compliance stance

Cold email in the US is a gray area, not a black one. We don't touch GDPR-protected geographies. Standard practices: sender identity in email, one-click unsubscribe honored, no misleading subject lines, no address harvesting. That covers CAN-SPAM. You already think in SaaS compliance so we'll flex to whatever internal bar you set.

The FTC and FBI enforcement pattern you mentioned (fingerprinting, 6-12 month evidence build, 2027 fines) is worth watching. For now we stay inside the practices the SaaS outbound community treats as safe.

What happens if Phase 1 doesn't hit

You keep the infrastructure, the data, the winning angles we did find, and the Claude Code system. No lock-in beyond the 2-month test window.

Next step

1. You approve this scope.
2. We kick off week 1: mailbox provisioning, data pull, ICP segmentation.
3. First campaigns live Day 5-7.
4. Weekly check-in every Friday.

Send back a quick yes or a redline and I'll queue up setup this weekend.
