

Proposal for Adrien, Seavium

Hassan, CrackClay. Based on our call.

Where you're at

Seavium is the AI platform for offshore vessel chartering and marine operations. Your ICP is three buyer personas: charter managers at shipping companies, vessel operators, and brokers connecting owners to charterers. You have product-market fit but GTM is fractured. You're running sporadic LinkedIn outreach, have no data infrastructure for your specific buyer signals (vessel employment changes, charter completion events, offshore wind project activity), and you're stretched thin operationally. You want to fix GTM before Series A close.

Why this angle wins

Most chartering platforms pitch features. We pitch signal. We reach your buyers by tracking three stacked triggers: new vessel employment events (AIS data + Maritime databases), offshore wind project activity (capex + hiring signals), and personnel changes at major shipping companies. That is not something your competitors can layer in at this velocity. It makes the conversation about capability, not price.

Data moat you own after this

Google Maps + LinkedIn + AIS data (via public APIs) + job posting monitoring + vessel registry lookups. Stored in your Clay + Claude Code system. Your buyers see you know their industry deeply. That trust converts faster than generic "we help shipping companies."

How I run the engagement

Start with a 10-day sprint to build one high-value signal workflow on your stack. Goal is to generate 50 to 80 qualified charter manager + vessel operator prospects with signal-backed personalization. If it lands, we build the full GTM engine. If it does not, you keep the data infrastructure and can iterate internally.

Signals we can layer. Vessel AIS pings showing employment changes. Charter completion events from public vessel registries. Hiring at shipping companies (particularly operations and sales roles). Offshore wind capex announcements. Merger activity in the marine space. All pulled via APIs into your Clay, then piped through Claude Code for personalization.

Copy angle. "We track vessel movements and crew changes. One workflow showed us you just employed a new fleet. Let's talk timing." Insider language. No generic cold email BS.

Automation. Claude Code + MCP replaces manual research. One workflow chains: detect signal → pull prospect data → personalize copy → output as CSV or Clay push → ready for

your outreach team. Your team gets a Claude Code seat and can adjust angles on the fly.

Tech budget, monthly

- AIS data access (via Spire Global or similar): \$300-800 depending on volume
- LinkedIn enrichment credits (if needed): \$100-200
- Claude Code seat: about \$100 (you likely have one already, just add me)
- Google Maps extraction: included
- Total budget: \$500-1100 depending on data source choice

Every account is in your name. If we part ways, everything stays with you.

Service fee

\$2,500 per month for the first 10 days (sprint phase). Work starts day one. By day 10 you have one live signal workflow, 50-80 prospects, and a working list with copy ready to send. From there, two paths: (1) Roll into full retainer (\$3,500-5,000/mo) to build 2-3 additional workflows, or (2) Keep the infrastructure and iterate in-house with async support.

No lock-in. Cancel anytime.

Weekly rhythm

During sprint: daily standups (async Slack). After sprint: 2-3 new signal workflows per month, 100-150 qualified prospects monthly, Friday reports on conversion rates and signal performance.

Timeline (10-day sprint)

- Day 0: Scope locked. Which signal layer first (AIS, wind projects, or hiring signals).
- Day 1-2: Data connectors live. AIS feed or job posting monitor wired to your Clay.
- Day 3-5: Workflow built. Signal detection → personalization → output automation.
- Day 6-8: Testing and iteration. Adjust copy angles, refine targeting.
- Day 9-10: List delivery and handover. 50-80 prospects ready. One working session on how to send.

What we deliver

- One live Claude Code workflow (files + prompts + docs)
- 50-80 qualified prospects with signal-backed personalization in CSV
- Copy templates for 3-5 outreach angles
- Data infrastructure (AIS, enrichment, job posting connectors) ready for additional workflows
- 30-day roadmap for signals 2 and 3

Team behind me

I work results-based, not hourly. Marine/logistics GTM is not my backyard, so I do the work. One data engineer and one GTM ops person on sprint weeks. You're not dealing with rotating contractors or learning curves on your buyers.

Next step

Reply yes and I will get AIS data onboarded by EOW. If the scope or pricing needs adjustment, tell me and I will adjust before sprint one starts.
